## 2 0 – 1 Knapsack

- The problem: We are given a knapsack of capacity  $W$  and a set of  $n$  items; an each item  $i$ , with  $1 \leq i \leq n$ , is worth  $v[i]$  and has weight  $w[i]$  pounds. Assume that weights  $w[i]$  and the total weight  $W$  are integers. The goal is to fill the knapsack so that the value of all items in the knapsack is maximized.
- Notation and choice of subproblem: Denote by  $\text{optknapsack}(k, w)$  the maximal value obtainable when filling a knapsack of capacity  $w$  using items among items 1 through  $k$ . To solve our problem we call  $\text{optknapsack}(n, W)$ .
- Recursive definition of  $\text{optknapsack}(k, w)$ :

```
optknapsack( $k, w$ )
```

```
if ( $w \leq 0$ ) or ( $k \leq 0$ ) : return 0 //basecase
IF ( $weight[k] \leq w$ ):  $with = value[k] + \text{optknapsack}(k - 1, w - weight[k])$ 
ELSE:  $with = 0$ 
 $without = \text{optknapsack}(k - 1, w)$ 
RETURN max {  $with, without$  }
```

- Correctness: see notes.
- Dynamic programming solution, top-down with memoization: We create a table  $table[1..n][1..W]$ , where  $table[i][w]$  will store the result of  $\text{optknapsack}(i, w)$ . We initialize all entries in the table as 0. To solve the problem, we call  $\text{optknapsackDP}(n, W)$ .

```
optknapsackDP( $k, w$ )
```

```
if ( $w \leq 0$ ) or ( $k \leq 0$ ): return 0
IF ( $table[k][w] \neq 0$ ): RETURN  $table[k][w]$ 
IF ( $w[k] \leq w$ ):  $with = v[k] + \text{optknapsackDP}(k - 1, w - w[k])$ 
ELSE:  $with = 0$ 
 $without = \text{optknapsackDP}(k - 1, w)$ 
 $table[k][w] = \max \{ with, without \}$ 
RETURN  $table[k][w]$ 
```

- Dynamic programming, bottom-up:

**optknapsackDP\_iterative**

```
create table[0..n][0..W] and initialize all entries to 0  
for ( $k = 1; k < n; k ++$ )  
    for ( $w = 1; w < W; w ++$ )  
        with =  $v[k] + table[k - 1][w - w[k]]$   
        without =  $table[k - 1][w]$   
         $table[k][w] = \max \{ \text{with, without} \}$   
RETURN  $table[n][W]$ 
```

- Analysis:  $O(n \cdot W)$
- Computing full solution:
