

Line segment intersection:

(I) **Orthogonal** line segment intersection

# Line segment intersection

- The problem (what)
- Applications (why)
- Algorithms (how)
  - A special case: Orthogonal line segments
  - Next time: General case: Bentley-Otman line sweep algorithm

# Line segment intersection

Problem: Given a set of line segments in 2D, find all their pairwise intersections.

# Line segment intersection

Problem: Given a set of line segments in 2D, find all their pairwise intersections.

# Line segment intersection

Problem: Given a set of line segments in 2D, find all their pairwise intersections.

Line segment intersection:

Applications

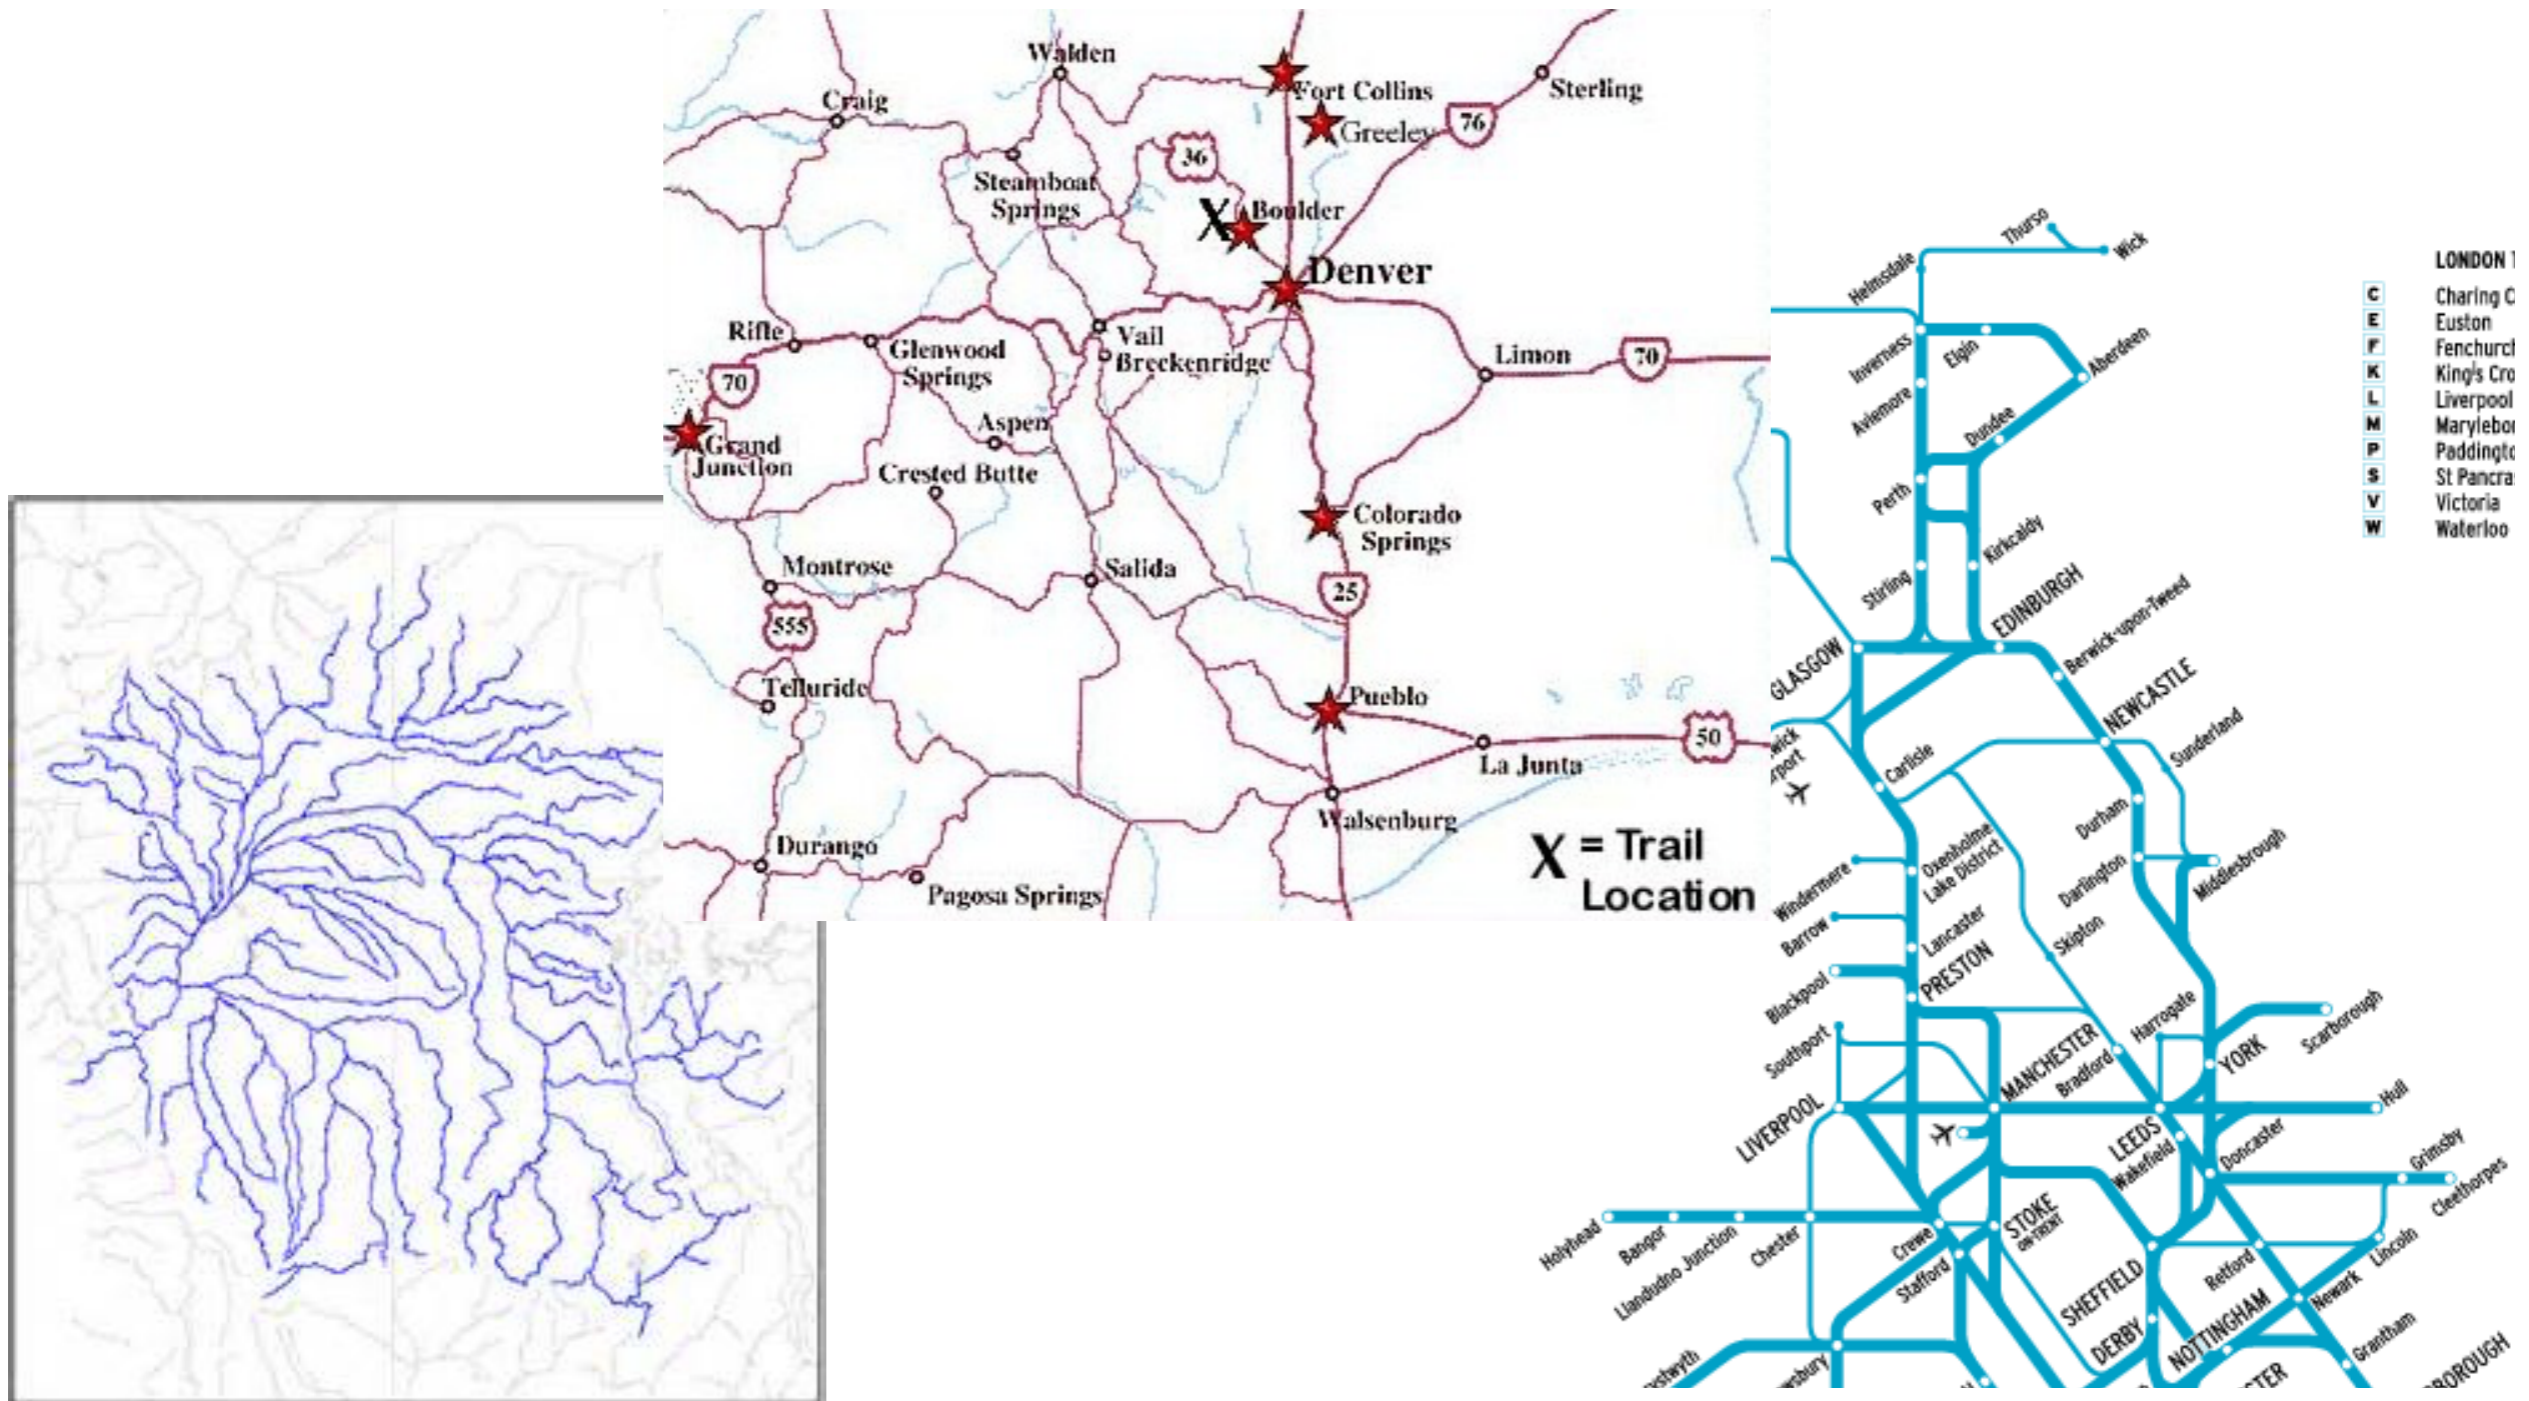

# Applications

Motion planning and collision detection in autonomous systems/robotics

# Applications

Geographic data: River networks, road networks, railways, ..

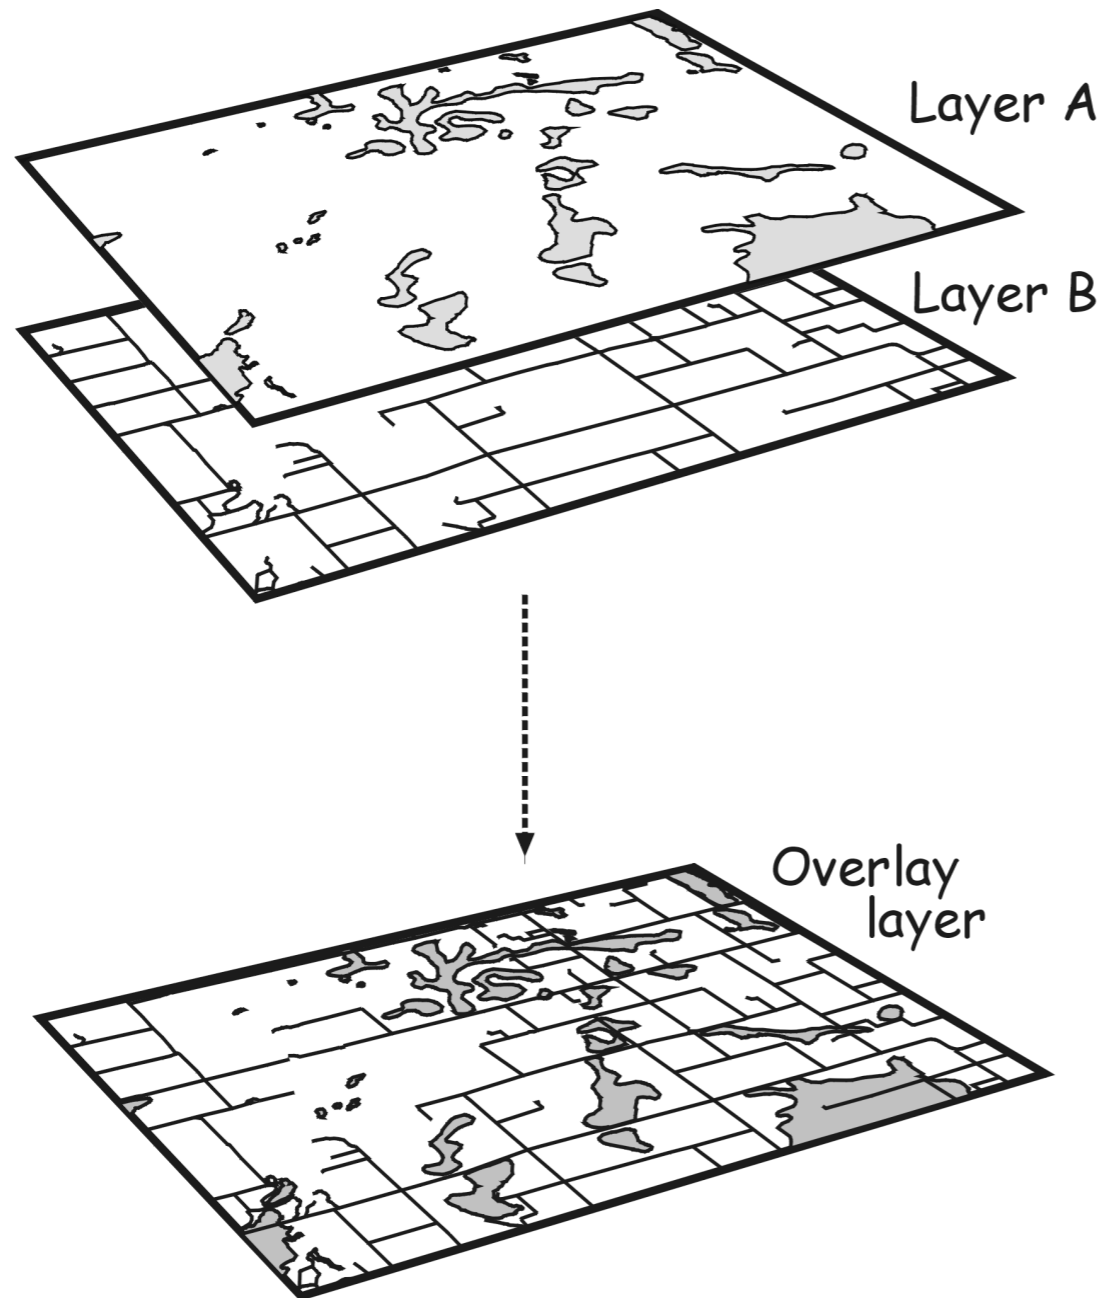

# Applications

Geographic data: River networks, road networks, railways, ..

# Applications

## Map overlay in GIS

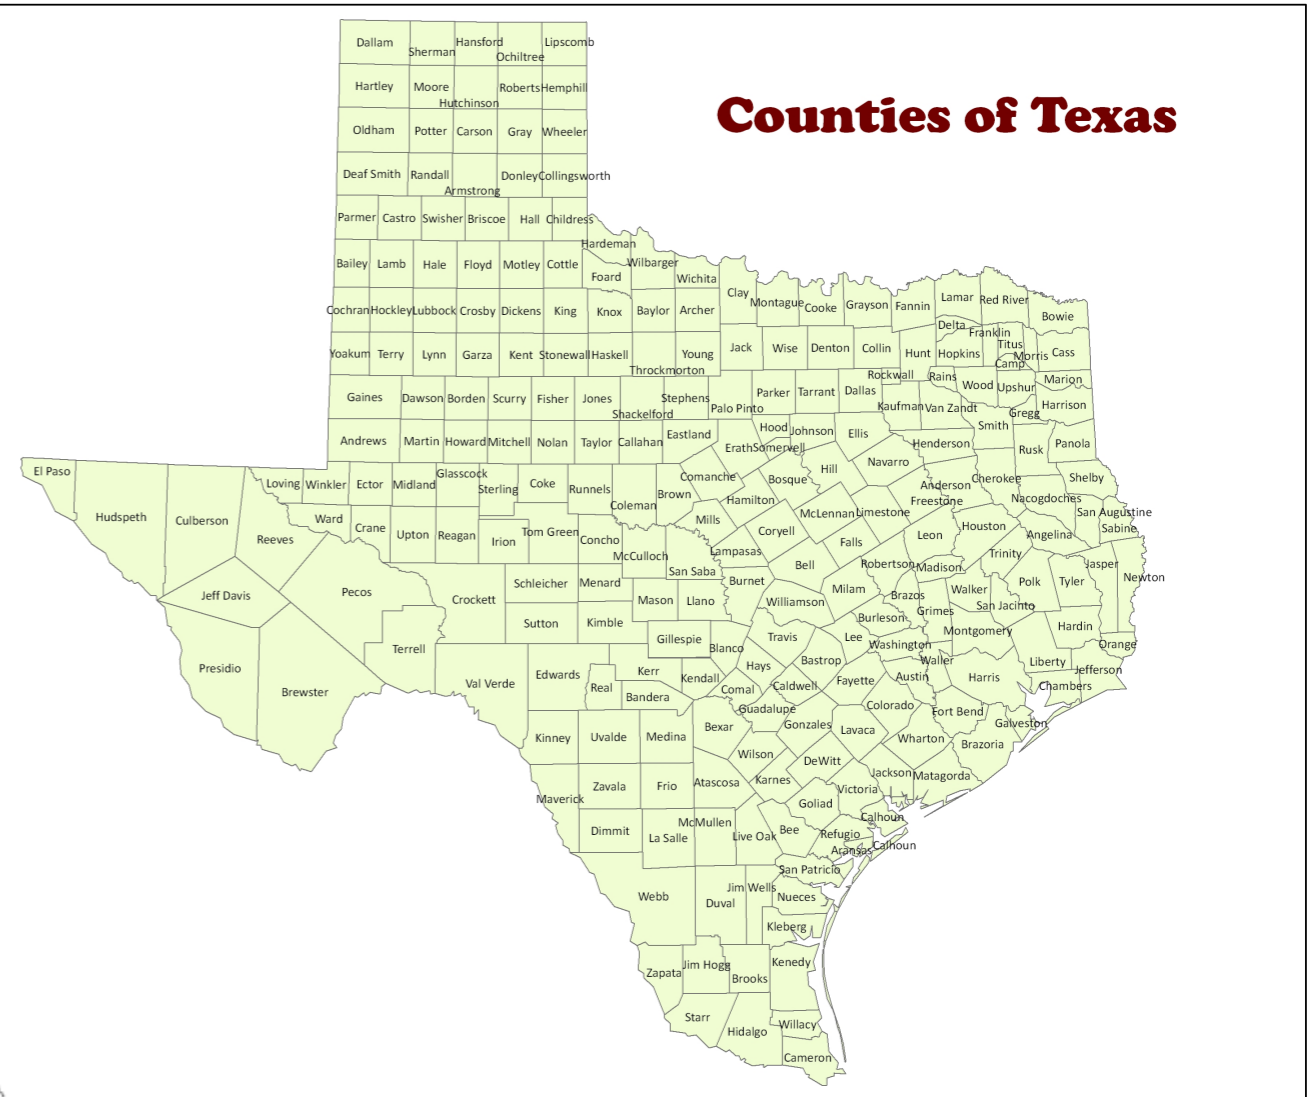

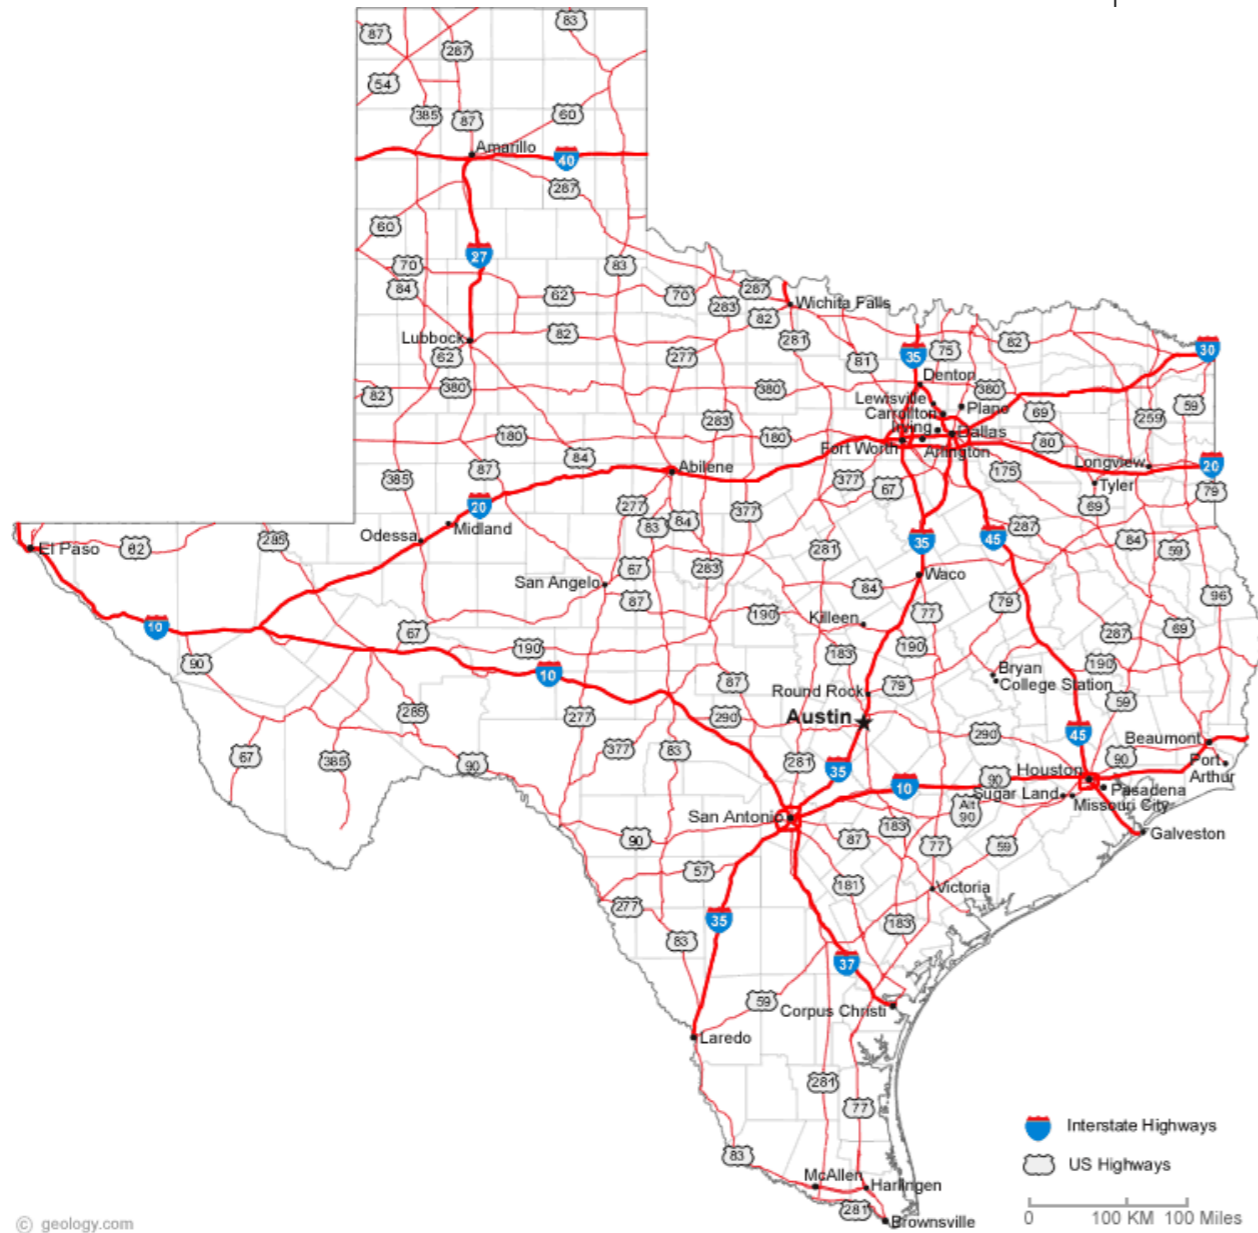

# Applications

Segment data in GIS: river network, road networks, counties, etc

# Applications

## Map overlay in GIS

# Computing line segment intersection: Algorithms

# Naive

## Notation

- $n$ : size of the input (number of segments)
- $k$ : size of output (number of intersections)

Problem: Given a set of  $n$  line segments in 2D, find all their pairwise intersections.

# Naive

## Notation

- $n$ : size of the input (number of segments)
- $k$ : size of output (number of intersections)

Problem: Given a set of  $n$  line segments in 2D, find all their pairwise intersections.

### To think:

- Give upper and lower bounds for  $k$ , draw examples that achieve these bounds.
- Give a straightforward algorithm that computes all intersections and analyze its running time. Give scenarios when this algorithm is efficient/inefficient.
- What is your intuition of an upper bound for this problem? (how fast would you hope to be able to solve it?)

## A special case: Orthogonal line segment intersection

Problem: Given a set of **orthogonal** line segments in 2D, find all their pairwise intersections.

## A special case: Orthogonal line segment intersection

Problem: Given a set of **orthogonal** line segments in 2D, find all their pairwise intersections.

To think:

- Come up with a straightforward algorithm and analyze its time
- Can you do better?

detour: range searching

# 1D Range Searching

- Given a set of values  $P = \{x_1, x_2, x_3, \dots, x_n\}$
- Pre-process it in order to answer

rangeSearch(a,b): return all elements in  $P$  in interval  $(a,b)$

# 1D Range Searching

- Given a set of values  $P = \{x_1, x_2, x_3, \dots, x_n\}$
- Pre-process it in order to answer

rangeSearch(a,b): return all elements in  $P$  in interval  $(a,b)$

- If  $P$  is static

# 1D Range Searching

- Given a set of values  $P = \{x_1, x_2, x_3, \dots, x_n\}$
- Pre-process it in order to answer

rangeSearch(a,b): return all elements in  $P$  in interval  $(a,b)$

- If  $P$  is static
  - sort, then binary search for  $a$  and walk.  $O(\lg n + k)$  per query

# 1D Range Searching

- Given a set of values  $P = \{x_1, x_2, x_3, \dots, x_n\}$
- Pre-process it in order to answer

rangeSearch(a,b): return all elements in  $P$  in interval  $(a,b)$

- If  $P$  is dynamic
  - use a BBST

$P$  changes by  
adding and  
deleting values

# 1D range searching with Binary Search Trees

Example: `range_search(21, 53)`: return 21, 34, 35, 46, 51, 52

# Balanced Binary Search Trees

- crash course -

# Binary Search Trees (BST)

- Operations
  - insert
  - delete
  - search
  - successor, predecessor
  - traversals (in order, ..)
  - min, max

# Balanced Binary Search Trees (BBST)

- Binary search trees + invariants that constrain the tree to be balanced
  - $h = O(\lg n)$
- These invariants have to be maintained when inserting and deleting
  - we can think of the tree as self-balancing
- BBST variants
  - red-black trees
  - AVL trees
  - B-trees
  - (a,b) trees
  - ...

# Example: Red-Black trees

- Binary search tree, and
  - Each node is Red or Black
  - The children of a Red node must be Black
  - The number of Black nodes on any path from the root to any node that does not have two children must be the same

- easier to conceptualize the tree as containing explicit NULL leaves, all Black
- the number of Black nodes on any root-to-leaf path must be the same

# Example: Red-Black trees

- Theorem:
  - A Red-Black tree of  $n$  nodes has height  $\Theta(\lg n)$ .

# Example: Red-Black trees

- **Theorem:**
  - After an insertion or a deletion, the RB tree invariants can be maintained in additional  $O(\lg n)$  time. This is done by performing rotations and recoloring nodes on the path from the inserted/deleted node to the root.

# Binary Search Trees

- Operations
  - insert
  - delete
  - search
  - successor, predecessor
  - traversals (in order, ..)
  - min, max
  - range search (1D)

# 1D range searching with Binary Search Trees

Example: `range_search(21, 53)`: return 21, 34, 35, 46, 51, 52

# 1D range searching with Binary Search Trees

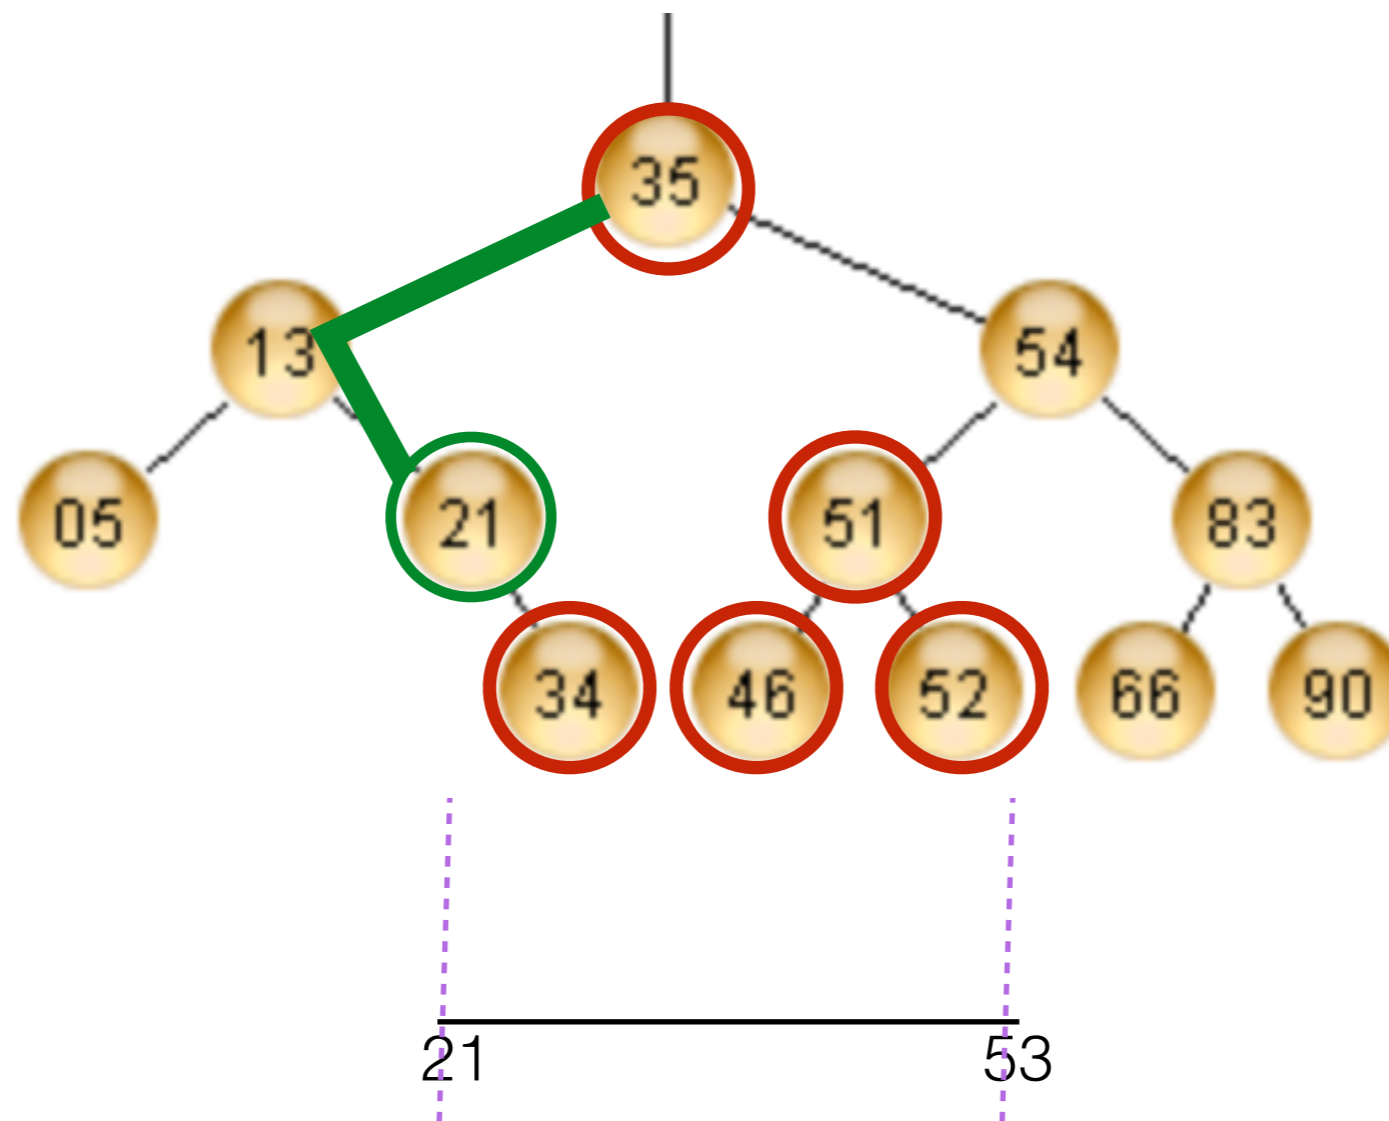

Example: `range_search(21, 53)`: return 21, 34, 35, 46, 51, 52

# 1D range searching with Binary Search Trees

Example: `range_search(21, 53)`: return 21, 34, 35, 46, 51, 52

# 1D range searching with Binary Search Trees

Example: `range_search(21, 53)`: return 21, 34, 35, 46, 51, 52

# 1D Range Searching with Red-Black Trees

Example: `range_search(10, 16)`: return 11, 13, 15

# 1D range searching with Binary Search Trees

- Range search (a,b):

# 1D range searching with Binary Search Trees

- Range search (a,b):
- Can be answered in  $O(\lg n + k)$ , where  $k = O(n)$  is the size of output

Balanced Binary Search Trees  
- end -

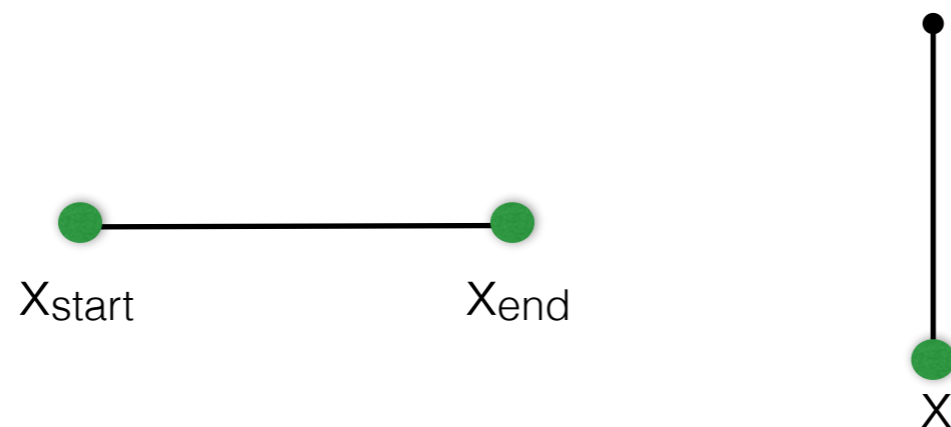

# The line sweep technique

# The line sweep technique

- Let  $X$  be the set of  $x$ -coordinates of all segments: these are the “events”

# The line sweep technique

- Let  $X$  be the set of  $x$ -coordinates of all segments: these are the “events”

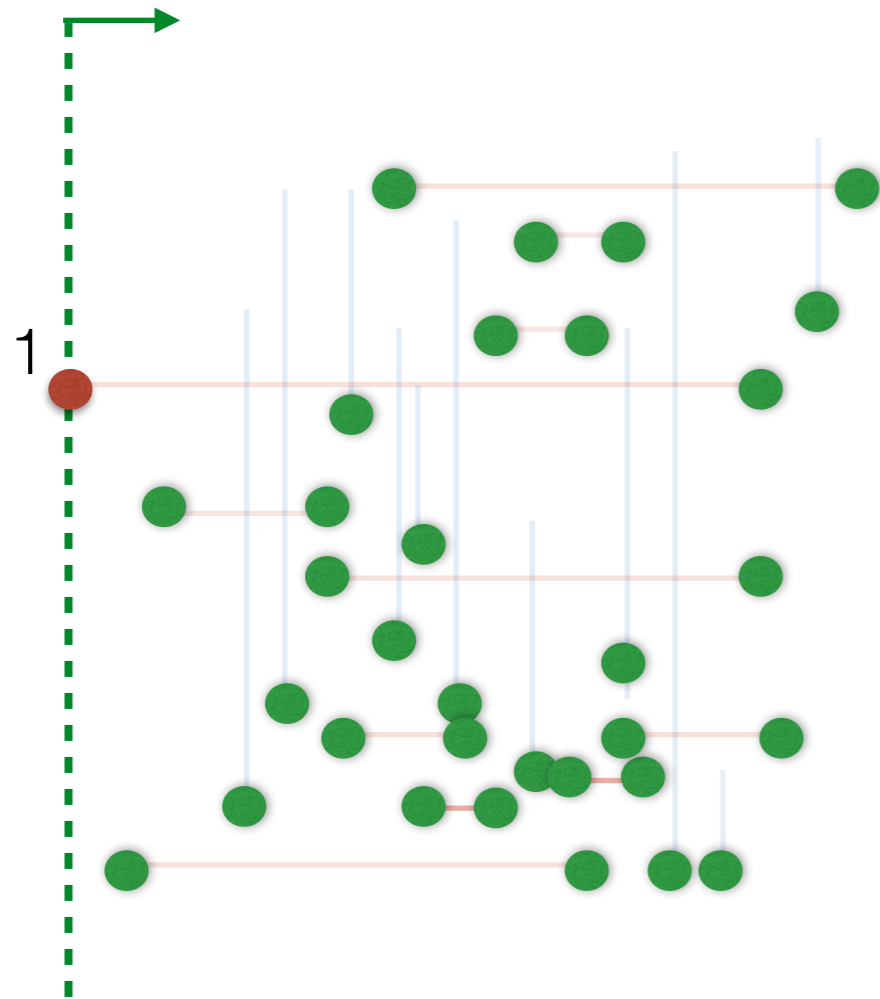

## The line sweep technique

- Traverse the **events** in order

# The line sweep technique

- Traverse the **events** in order

# The line sweep technique

- Traverse the **events** in order

# The line sweep technique

- Traverse the **events** in order

## The line sweep technique

And so on.

How to process events?

When reach a start event: segment becomes active

# The line sweep technique

this is now active

When reach a start event: segment becomes active

# The line sweep technique

When reach a start event: segment becomes active

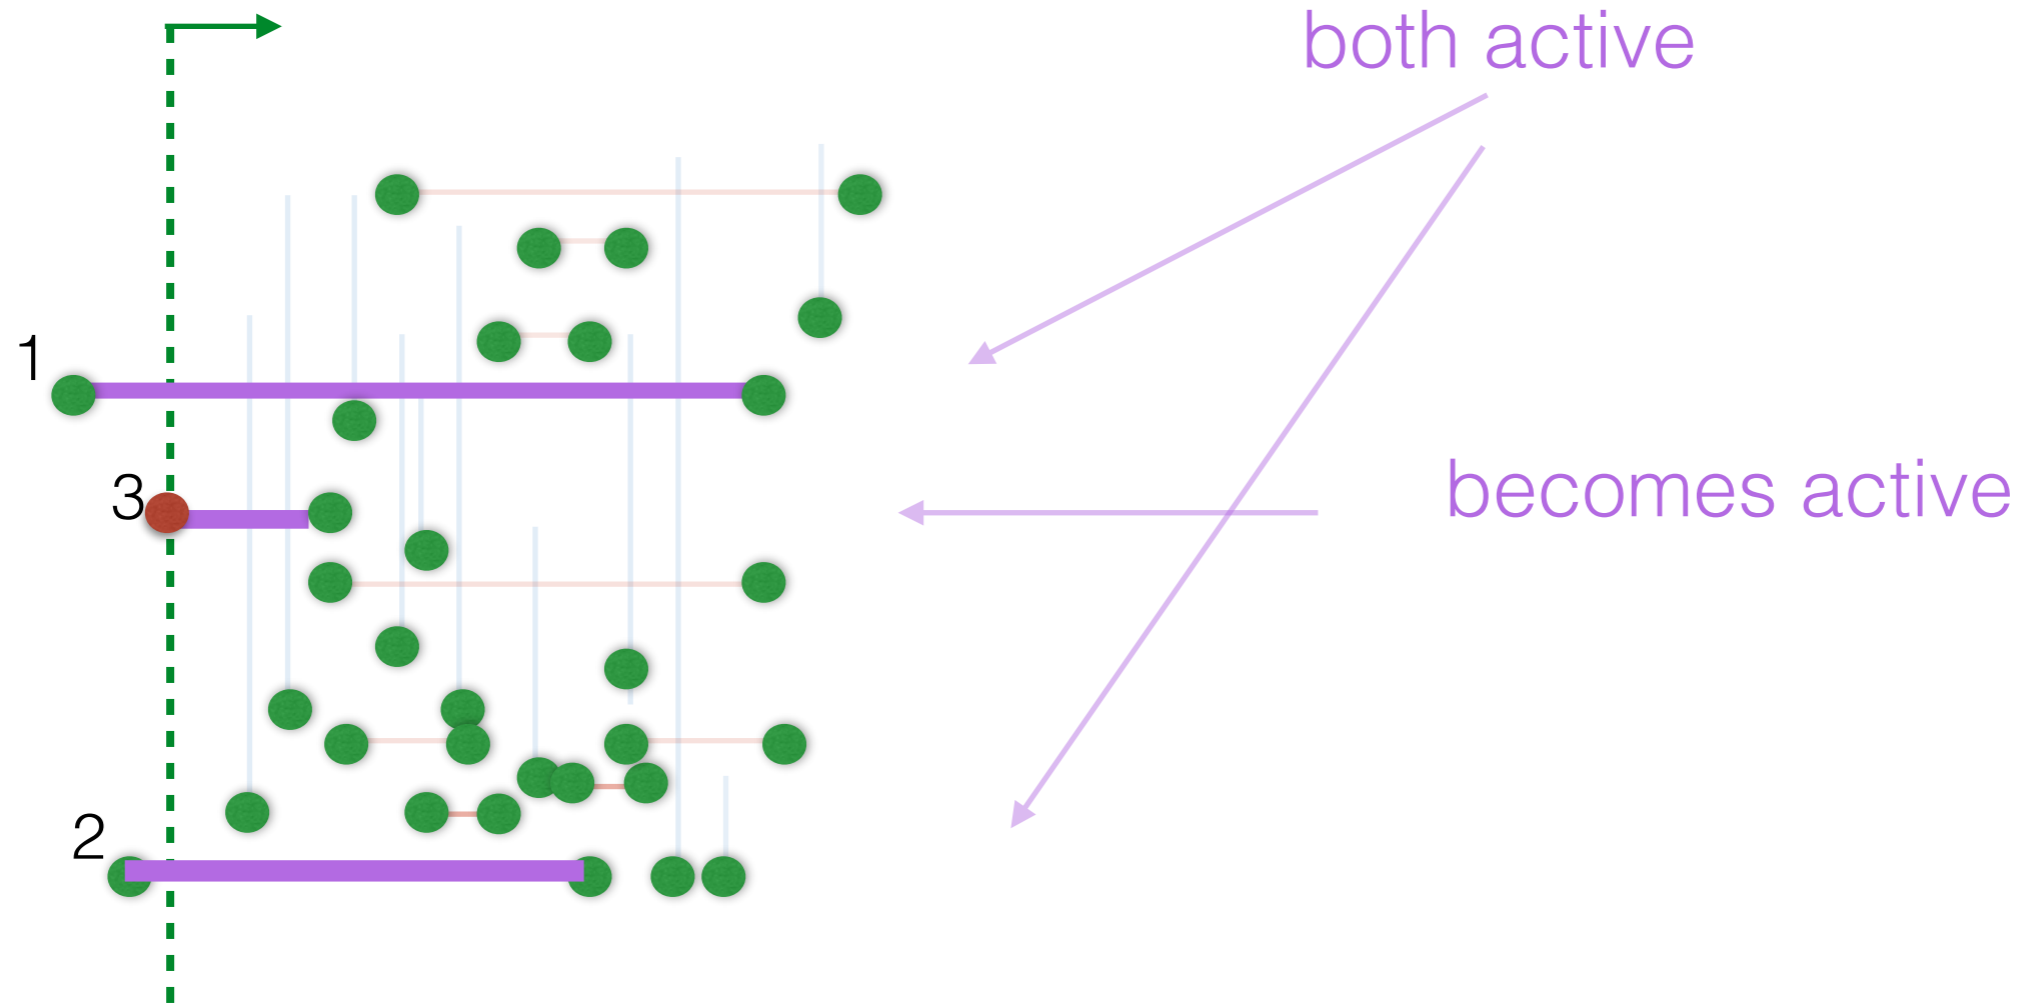

# The line sweep technique

When reach a start event: segment becomes active

# The line sweep technique

When reach a start event: segment becomes active

Let's see what happens when we reach an event  
corresponding to a vertical segment

# The line sweep technique

When reach an event corresponding to a vertical segment:

Claim: All horizontal segments that it intersects must be active

But, not all active segments intersect the vertical segment

## The line sweep technique

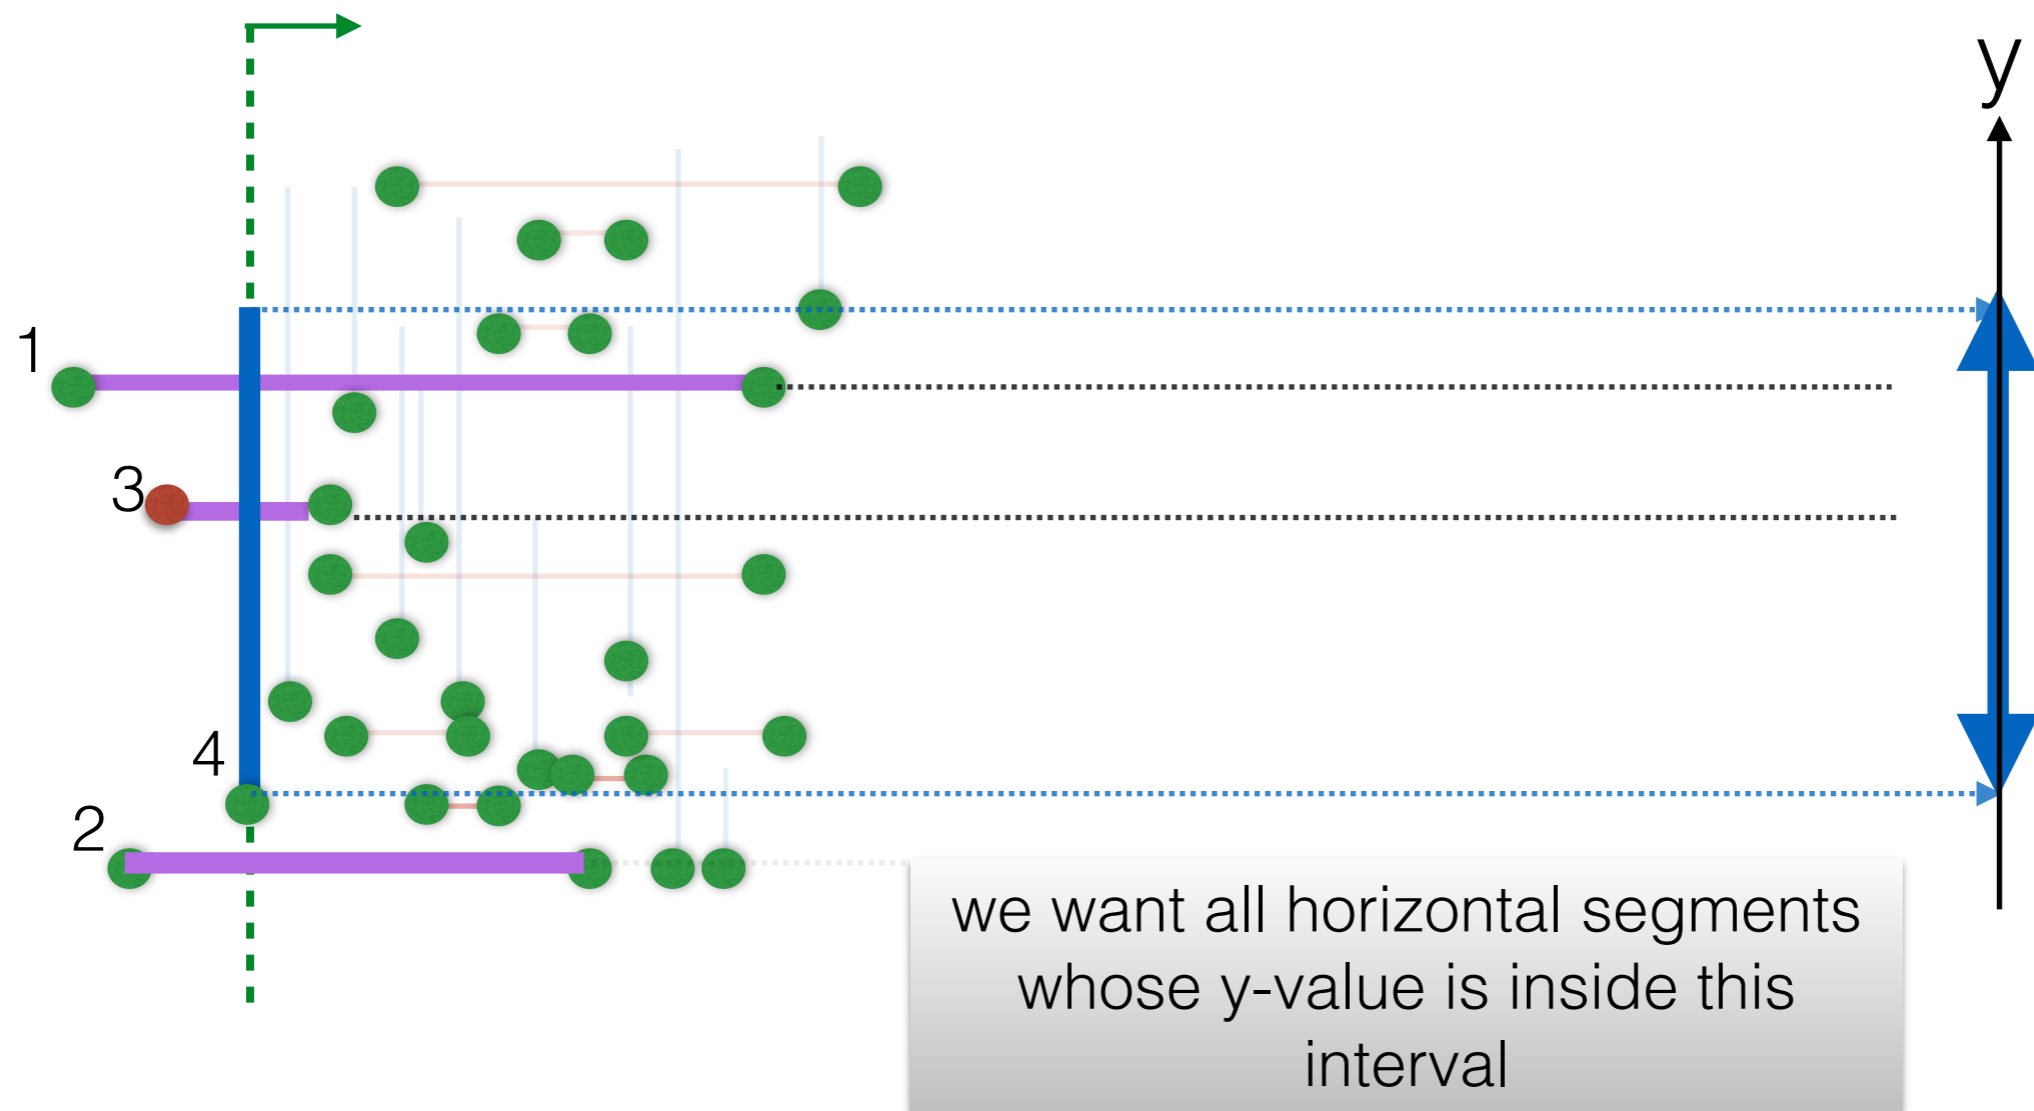

When reach an event corresponding to a vertical segment:

Claim: All horizontal segments that it intersects must be active

But, not all active segments intersect the vertical segment

## The line sweep technique

When reach an event corresponding to a vertical segment:

Claim: All horizontal segments that it intersects must be active

But, not all active segments intersect the vertical segment

## Orthogonal line segment intersection

- Let  $X$  be the set of  $x$ -coordinates of all segments  
//the events
- Initialize  $AS = \{\}$
- Sort  $X$  and traverse the events in sorted order; let  $x$  be the next event in  $X$ 
  - if  $x$  is start of horizontal segment  $(x, x', y)$ :  
//segment becomes active  
**insert segment  $(x, x', y)$  in  $AS$**
  - if  $x$  is end of horizontal segment  $(x, x', y)$ :  
//segment stops being active  
**delete segment  $(x, x', y)$  from  $AS$**
  - if  $x$  corresponds to a vertical segment  $(y, y', x)$ :  
//All active segments start before  $x$  and end after  $x$ . We need those whose  $y$  is in  $[y, y']$   
**search  $AS$  for all segments with  $y$ -value in given range  $[y, y']$  and report intersections**

## Orthogonal line segment intersection

- Let  $X$  be the set of  $x$ -coordinates of all segments  
//the events
- Initialize  $AS = \{\}$
- Sort  $X$  and traverse the events in sorted order; let  $x$  be the next event in  $X$ 
  - if  $x$  is start of horizontal segment  $(x, x', y)$ :  
//segment becomes active  
**insert segment  $(x, x', y)$  in  $AS$**
  - if  $x$  is end of horizontal segment  $(x, x', y)$ :  
//segment stops being active  
**delete segment  $(x, x', y)$  from  $AS$**
  - if  $x$  corresponds to a vertical segment  $(y, y', x)$ :  
//All active segments start before  $x$  and end after  $x$ . We need those whose  $y$  is in  $[y, y']$   
**search  $AS$  for all segments with  $y$ -value in given range  $[y, y']$  and report intersections**

## Orthogonal line segment intersection

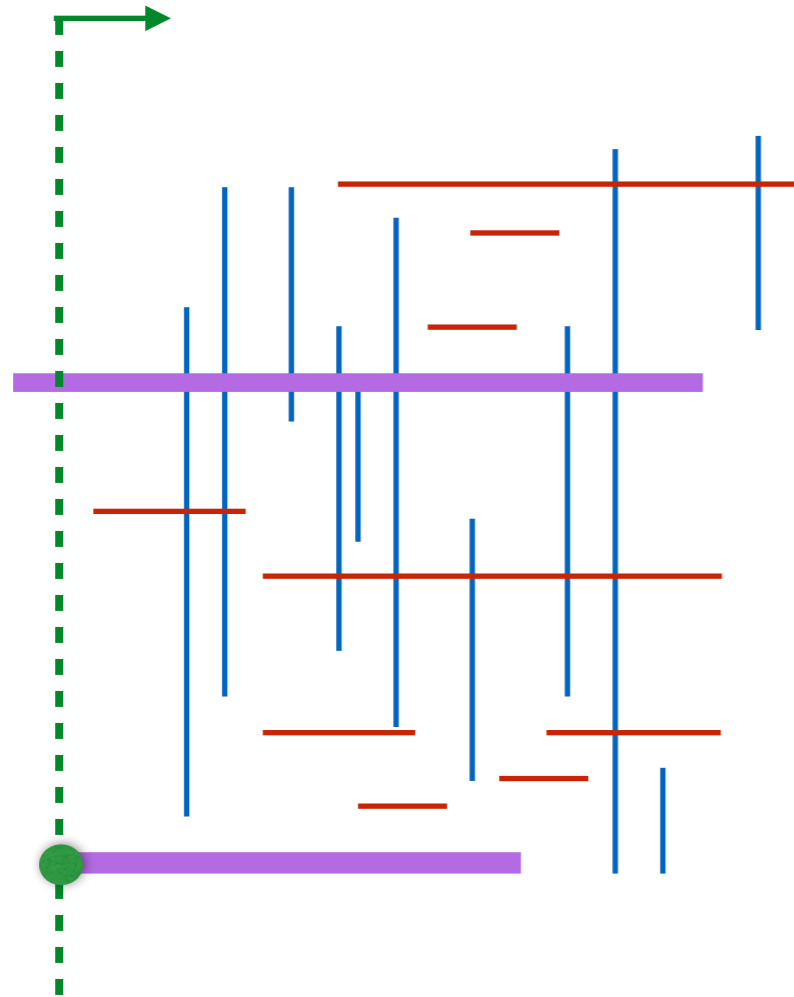

- Let  $X$  be the set of  $x$ -coordinates of all segments  
//the events
- Initialize  $AS = \{\}$

**search  $AS$  for all segments with  $y$ -value in given range  $[y, y']$  and report intersections**

## Orthogonal line segment intersection

- To think
  - How to implement the AS?
  - Analysis

- Let  $X$  be the set of  $x$ -coordinates of all segments  
//the events
- Initialize  $AS = \{\}$
- Sort  $X$  and traverse the events in sorted order; let  $x$  be the next event in  $X$ 
  - if  $x$  is start of horizontal segment  $(x, x', y)$ :  
//segment becomes active  
**insert segment  $(x, x', y)$  in AS**
  - if  $x$  is end of horizontal segment  $(x, x', y)$ :  
//segment stops being active  
**delete segment  $(x, x', y)$  from AS**
  - if  $x$  corresponds to a vertical segment  $(y, y', x)$ :  
//All active segments start before  $x$  and end after  $x$ . We need those whose  $y$  is in  $[y, y']$   
**search AS for all segments with  $y$ -value in given range  $[y, y']$  and report intersections**

# Line sweep

# Line sweep algorithms

- Powerful, elegant, frequently used technique
- Line can be horizontal or vertical or radial or ....

- Traverse events in order and maintain an Active Structure (AS)
  - AS contains objects that are “active” (started but not ended) in other words they are intersected by the current sweep line
  - at some events, insert in AS
  - at some events, delete from AS
  - at some events, query AS
