# Orthogonal line segment intersection

Laura Toma  
Bowdoin College

2

### Line segment intersection

- The problem (what)
- Applications (why)
- Algorithms (how)
  - A special case: Orthogonal line segments
  - General case and Bentley-Otman line sweep algorithm

3

### Line segment intersection

Problem: Given a set of line segments in 2D, find all their pairwise intersections.

4

### Line segment intersection

Problem: Given a set of line segments in 2D, find all their pairwise intersections.

5

### Line segment intersection

Problem: Given a set of line segments in 2D, find all their pairwise intersections.

6

### Applications

Graphics: rendering => hidden surfaces ==> intersections

7

### Applications

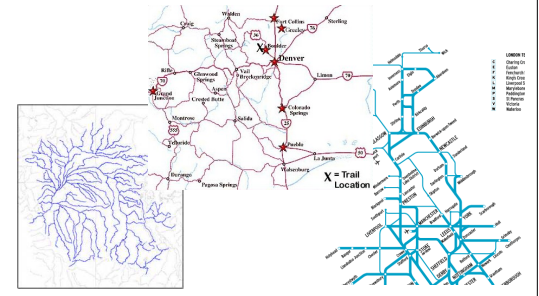

Motion planning and collision detection in autonomous systems/robotics

8

### Applications

Geographical data: River networks, road networks, railways, ...

9

### Applications

Geographical data: River networks, road networks, railways, ...

10

### Applications

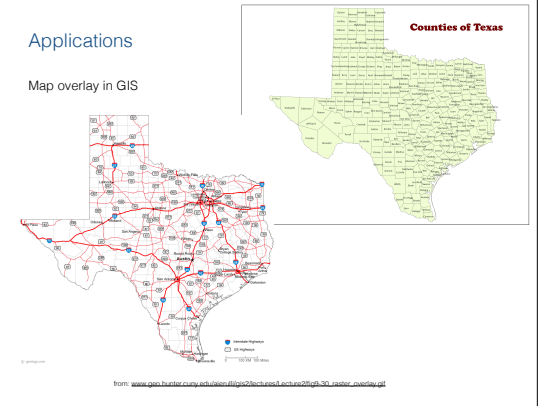

Map overlay in GIS

11

### Applications

Map overlay in GIS

12

## Algorithms

13

### Naive

#### Notation

- $n$ : size of the input (number of segments)
- $k$ : size of output (number of intersections)

Problem: Given a set of  $n$  line segments in 2D, find all their pairwise intersections.

#### Exercises:

- Give upper and lower bounds for  $k$ , draw examples that achieve these bounds.
- Give a straightforward algorithm that computes all intersections and analyze its running time. Give scenarios when this algorithm is efficient/inefficient.
- What is your intuition of an upper bound for this problem? (how fast would you hope to be able to solve it?)

14

### A special case: Orthogonal line segment intersection

#### Exercises

- Come up with a straightforward algorithm and analyze its time
- Improved algorithm?

15

## Balanced Binary Search Trees - review -

16

### Binary Search Trees (BST)

#### Operations

- insert
- delete
- search
- successor, predecessor
- traversals (in order, ...)
- min, max

17

### Balanced Binary Search Trees (BBST)

- Binary search trees + invariants that constrain the tree to be balanced (and thus have logarithmic height)
- These invariants have to be maintained when inserting and deleting (so we can think of the tree as self-balancing)

#### BBST variants

- red-black trees
- AVL trees
- B-trees
- (a,b) trees
- ...

18

### Example: Red-Black trees

- Binary search tree, and
  - Each node is Red or Black
  - The children of a Red node must be Black
  - The number of Black nodes on any path from the root to any node that does not have two children must be the same

Note:

- easier to conceptualize the tree as containing explicit NULL leaves, all Black
- the number of Black nodes on any root-to-leaf path must be the same

19

### Example: Red-Black trees

- Theorem:
  - A Red-Black tree of  $n$  nodes has height  $\Theta(\lg n)$ .

20

### Example: Red-Black trees

- Theorem:
  - After an insertion or a deletion, the RB tree invariants can be maintained in additional  $O(\lg n)$  time. This is done by performing rotations and recoloring nodes on the path from the inserted/deleted node to the root.

21

### Binary Search Trees

- Operations
  - insert
  - delete
  - search
  - successor, predecessor
  - traversals (in order, ..)
  - min, max
  - range search (1D)

22

### 1D Range Searching

- Given a set of values  $P = \{x_1, x_2, x_3, \dots, x_n\}$
- Pre-process it in order to answer
  - rangeSearch(a,b): return all elements in  $P$  in interval (a,b)

23

### 1D Range Searching

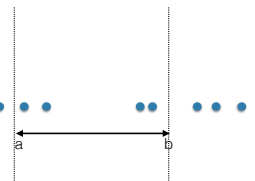

- Given a set of values  $P = \{x_1, x_2, x_3, \dots, x_n\}$
- Pre-process it in order to answer
  - rangeSearch(a,b): return all elements in  $P$  in interval (a,b)

24

### 1D Range Searching

- Given a set of values  $P = \{x_1, x_2, x_3, \dots, x_n\}$
- Pre-process it in order to answer
  - `rangeSearch(a,b)`: return all elements in  $P$  in interval  $(a,b)$

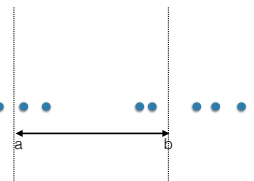

- If  $P$  is static
  - Ideas?

25

### 1D Range Searching

- Given a set of values  $P = \{x_1, x_2, x_3, \dots, x_n\}$
- Pre-process it in order to answer
  - `rangeSearch(a,b)`: return all elements in  $P$  in interval  $(a,b)$

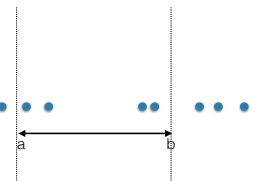

- If  $P$  is static
  - Pre-process: sort
  - Range search: binary search,  $O(\lg n + k)$  per query

26

### 1D Range Searching

- Given a set of values  $P = \{x_1, x_2, x_3, \dots, x_n\}$
- Pre-process it in order to answer
  - `rangeSearch(a,b)`: return all elements in  $P$  in interval  $(a,b)$

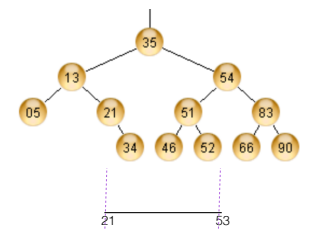

- If  $P$  is static
- If  $P$  is dynamic:
  - use BBST

27

### 1D range searching with Binary Search Trees

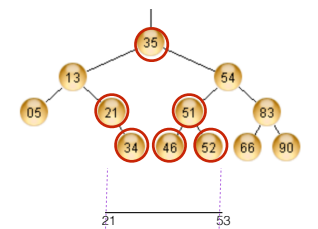

Example: `range_search(21, 53)`: return 21, 34, 35, 46, 51, 52

28

### 1D range searching with Binary Search Trees

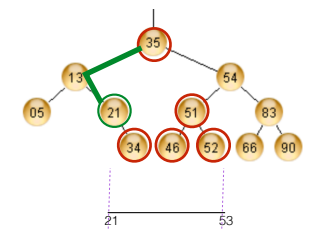

Example: `range_search(21, 53)`: return 21, 34, 35, 46, 51, 52

29

### 1D range searching with Binary Search Trees

Example: `range_search(21, 53)`: return 21, 34, 35, 46, 51, 52

30

### 1D range searching with Binary Search Trees

Example: range\_search(21, 53): return 21, 34, 35, 46, 51, 52

31

### 1D Range Searching with Red-Black Trees

Example: range\_search(10, 16): return 11, 13, 15

32

### 1D range searching with Binary Search Trees

• Range search (a,b): return all elements in this interval

33

### 1D range searching with Binary Search Trees

- Range search (a,b): return all elements in this interval
- Can be answered in  $O(\lg n + k)$ , where  $k = O(n)$  is the size of output

34

### Orthogonal line segment intersection

36

Orthogonal line segment intersection

- Let  $X$  be the set of  $x$ -coordinates of all segments //the "events"

37

Orthogonal line segment intersection

line sweep technique  
solve the problem behind the line

- Let  $X$  be the set of  $x$ -coordinates of all segments //our "events"
- Sort  $X$  and traverse the events in order

38

Orthogonal line segment intersection

line sweep technique  
solve the problem behind the line

- Let  $X$  be the set of  $x$ -coordinates of all segments //our "events"
- Sort  $X$  and traverse the events in order

39

Orthogonal line segment intersection

line sweep technique  
solve the problem behind the line

- Let  $X$  be the set of  $x$ -coordinates of all segments //our "events"
- Sort  $X$  and traverse the events in order

40

Orthogonal line segment intersection

line sweep technique  
solve the problem behind the line

- Let  $X$  be the set of  $x$ -coordinates of all segments //our "events"
- Sort  $X$  and traverse the events in order

41

Orthogonal line segment intersection

line sweep technique  
solve the problem behind the line

- Let  $X$  be the set of  $x$ -coordinates of all segments //our "events"
- Sort  $X$  and traverse the events in order

42

Orthogonal line segment intersection

line sweep technique  
solve the problem behind the line

Events

- beginning of a horizontal segment
- end of a horizontal segment
- vertical segment

43

Orthogonal line segment intersection

Line sweep technique

- Events
- Traverse events in order and maintain an Active Structure (AS)
  - AS contains objects that are "active" (started but not ended) in other words they are intersected by the present sweep line
- at certain events, insert in AS
- at certain events, delete from AS
- at other events, query AS

Events

- beginning of a horizontal segment
- end of a horizontal segment
- vertical segment

44

Orthogonal line segment intersection

- Let  $X$  be the set of  $x$ -coordinates of all segments //the events
- Initialize  $AS = \{\}$
- Sort  $X$  and traverse the events in sorted order, let  $x$  be the next event in  $X$ 
  - if  $x$  is start of horizontal segment  $(x, x', y)$ :
    - //segment becomes active
    - insert segment  $(x, x', y)$  in AS
  - if  $x$  is end of horizontal segment  $(x, x', y)$ :
    - //segment stops being active
    - delete segment  $(x, x', y)$  from AS
  - if  $x$  corresponds to a vertical segment  $(y, y', x)$ :
    - //All active segments start before  $x$  and end after  $x$ . We need those whose  $y$  is in  $[y, y']$
    - search AS for all segments with  $y$ -value in given range  $[y, y']$  and report intersections

AS=?  
in order to do this efficiently

45

Orthogonal line segment intersection

- Let  $X$  be the set of  $x$ -coordinates of all segments //the events
- Initialize  $AS = \{\}$
- Sort  $X$  and traverse the events in sorted order, let  $x$  be the next event in  $X$ 
  - if  $x$  is start of horizontal segment  $(x, x', y)$ :
    - //segment becomes active
    - insert segment  $(x, x', y)$  in AS
  - if  $x$  is end of horizontal segment  $(x, x', y)$ :
    - //segment stops being active
    - delete segment  $(x, x', y)$  from AS
  - if  $x$  corresponds to a vertical segment  $(y, y', x)$ :
    - //All active segments start before  $x$  and end after  $x$ . We need those whose  $y$  is in  $[y, y']$
    - search AS for all segments with  $y$ -value in given range  $[y, y']$  and report intersections

AS=?  
in order to do this efficiently

46

Orthogonal line segment intersection

- Let  $X$  be the set of  $x$ -coordinates of all segments //the events
- Initialize  $AS = \{\}$
- Sort  $X$  and traverse the events in sorted order, let  $x$  be the next event in  $X$ 
  - if  $x$  is start of horizontal segment  $(x, x', y)$ :
    - //segment becomes active
    - insert segment  $(x, x', y)$  in AS
  - if  $x$  is end of horizontal segment  $(x, x', y)$ :
    - //segment stops being active
    - delete segment  $(x, x', y)$  from AS
  - if  $x$  corresponds to a vertical segment  $(y, y', x)$ :
    - //All active segments start before  $x$  and end after  $x$ . We need those whose  $y$  is in  $[y, y']$
    - search AS for all segments with  $y$ -value in given range  $[y, y']$  and report intersections

AS=?  
in order to do this efficiently

47

Orthogonal line segment intersection

- Let  $X$  be the set of  $x$ -coordinates of all segments //the events
- Initialize  $AS = \{\}$
- Sort  $X$  and traverse the events in sorted order, let  $x$  be the next event in  $X$ 
  - if  $x$  is start of horizontal segment  $(x, x', y)$ :
    - //segment becomes active
    - insert segment  $(x, x', y)$  in AS
  - if  $x$  is end of horizontal segment  $(x, x', y)$ :
    - //segment stops being active
    - delete segment  $(x, x', y)$  from AS
  - if  $x$  corresponds to a vertical segment  $(y, y', x)$ :
    - //All active segments start before  $x$  and end after  $x$ . We need those whose  $y$  is in  $[y, y']$
    - search AS for all segments with  $y$ -value in given range  $[y, y']$  and report intersections

AS=?  
in order to do this efficiently

48

Orthogonal line segment intersection

AS=?  
in order to do this efficiently

- Let  $X$  be the set of  $x$ -coordinates of all segments  
//the events
- Initialize  $AS = \{\}$
- Sort  $X$  and traverse the events in sorted order; let  $x$  be the next event in  $X$

**search AS for all segments with  $y$ -value in given range  $[y, y']$  and report intersections**

54

### Orthogonal line segment intersection

AS=?  
in order to do this efficiently

- Let  $X$  be the set of  $x$ -coordinates of all segments  
*//the events*
- Initialize  $AS = \{\}$
- Sort  $X$  and traverse the events in sorted order; let  $x$  be the next event in  $X$ 
  - if  $x$  is start of horizontal segment  $(x, x', y)$ :  
*//segment becomes active*  
insert segment  $(x,x',y)$  in  $AS$
  - if  $x$  is end of horizontal segment  $(x, x', y)$ :  
*//segment stops being active*  
delete segment  $(x,x',y)$  from  $AS$
  - if  $x$  corresponds to a vertical segment  $(y, y', x)$ :  
*//All active segments start before  $x$  and end after  $x$ . We need those whose  $y$  is in  $[y,y']$*   
search  $AS$  for all segments with  $y$ -value in given range  $[y,y']$  and report intersections

55

### Orthogonal line segment intersection

AS=?  
in order to do this efficiently

- Let  $X$  be the set of  $x$ -coordinates of all segments  
*//the events*
- Initialize  $AS = \{\}$
- Sort  $X$  and traverse the events in sorted order; let  $x$  be the next event in  $X$ 
  - if  $x$  is start of horizontal segment  $(x, x', y)$ :  
*//segment becomes active*  
insert segment  $(x,x',y)$  in  $AS$
  - if  $x$  is end of horizontal segment  $(x, x', y)$ :  
*//segment stops being active*  
delete segment  $(x,x',y)$  from  $AS$
  - if  $x$  corresponds to a vertical segment  $(y, y', x)$ :  
*//All active segments start before  $x$  and end after  $x$ . We need those whose  $y$  is in  $[y,y']$*   
search  $AS$  for all segments with  $y$ -value in given range  $[y,y']$  and report intersections

56

### Orthogonal line segment intersection

AS=?  
in order to do this efficiently

- Let  $X$  be the set of  $x$ -coordinates of all segments  
*//the events*
- Initialize  $AS = \{\}$
- Sort  $X$  and traverse the events in sorted order; let  $x$  be the next event in  $X$ 
  - if  $x$  is start of horizontal segment  $(x, x', y)$ :  
*//segment becomes active*  
insert segment  $(x,x',y)$  in  $AS$
  - if  $x$  is end of horizontal segment  $(x, x', y)$ :  
*//segment stops being active*  
delete segment  $(x,x',y)$  from  $AS$
  - if  $x$  corresponds to a vertical segment  $(y, y', x)$ :  
*//All active segments start before  $x$  and end after  $x$ . We need those whose  $y$  is in  $[y,y']$*   
search  $AS$  for all segments with  $y$ -value in given range  $[y,y']$  and report intersections

57

### Orthogonal line segment intersection

- Pick an example and simulate the algorithm
- How do you implement the AS?
- Analysis?

- Let  $X$  be the set of  $x$ -coordinates of all segments  
*//the events*
- Initialize  $AS = \{\}$
- Sort  $X$  and traverse the events in sorted order; let  $x$  be the next event in  $X$ 
  - if  $x$  is start of horizontal segment  $(x, x', y)$ :  
*//segment becomes active*  
insert segment  $(x,x',y)$  in  $AS$
  - if  $x$  is end of horizontal segment  $(x, x', y)$ :  
*//segment stops being active*  
delete segment  $(x,x',y)$  from  $AS$
  - if  $x$  corresponds to a vertical segment  $(y, y', x)$ :  
*//All active segments start before  $x$  and end after  $x$ . We need those whose  $y$  is in  $[y,y']$*   
search  $AS$  for all segments with  $y$ -value in given range  $[y,y']$  and report intersections

58

### Line sweep

- Frequently used technique
- Line can be horizontal or vertical or radial or ....

- Traverse events in order and maintain an Active Structure (AS)
  - AS maintains objects that are "active" (started but not ended) in other words they are intersected by the present sweep line
  - at certain events, insert in AS
  - at certain events, delete from AS
  - at other events, query AS

59
